

# Corrosive GHS Sign

## Product Images

## Description

- This GHS sign communicates the existence of corrosive chemicals that are likely to cause severe skin and eye damage and can be corrosive to metals.
- Chemical examples: Nitric acid, Mercury and Sodium hydroxide.
- Hazard is represented by corrosive pictogram: chemical drips corroding object and hand.
- GHS signs are required as a precaution to ensure safe handling, storage and disposal of hazardous chemicals.
- This GHS sign must be visibly displayed on:

1. The individual container of a corrosive chemical, and;
2. The exterior of the facility, vehicle or storage container in which the chemical is located/stored - To appropriately inform and alert emergency services in the case of an emergency.

About the GHS system:

- For information on GHS labelling, positioning, storage and disposal, [WorkSafe Australia's Code of Practice](#).
- The Globally Harmonized System (GHS) is a single, global methodology for chemical classification that was adopted by Australia as of Jan 1<sup>st</sup> 2017.
- GHS intends to improve international trade of dangerous goods and universal comprehension of chemical hazards.
- All workplace chemicals must be labelled according to GHS as implemented under [Australian WHS regulations](#).
- Chemical manufacturers and suppliers (including importers) are responsible for appropriately using the GHS system.
- [Click here](#) to determine which GHS pictogram is required for the chemicals in your workplace.
